Cognitive Therapeutics Method Interventionist

Can you see what I’m saying?

Visual-spatial perception is the ability to accurately perceive an object’s physical location and understand the relationship between objects. Therefore, visual-spatial processing is critical in most physical interactions people have with their surroundings.

A loss in this area can result in higher risks for falling, since seeing a step, curb, or a slope becomes much harder. This is different from a loss in vision itself, which can compound the symptoms of visual-spatial perception deficits.

As we age we naturally lose some components of vision, such as shades of color and brightness. When that occurs over time we barely notice until the loss is significant. The danger comes when you no longer process shades of color and brightness. When that occurs components of vision, such as shades of color and brightness, become much harder. This is different from a loss in vision itself, which can compound the symptoms of visual-spatial perception deficits.

Another great exercise is using a complex array of combined objects and working at identifying each of the individual entangled objects. Mentally disentangling an object into its component parts engages the visual-spatial domain, as well as the attention domain, giving your brain a great workout.

Over the course of the past several weeks we have talked about some of the incredible breakthroughs in dementia treatment, ways to improve diet, the benefits of increased social interaction, and the real value of cognitive activities. These are the things that we at Home Care Assistance not only believe in and practice, but can implement. In balanced care with all of our clients, whether or not a person is diagnosed with a form of dementia, because changing your life works. We also know that as we age it becomes increasingly challenging to make these changes, and asking for help is hard sometimes. To that effect we offer care giving services designed to enrich lives, and increase quality of life at the same price or lower than our competitors. Our goal is also our motto. We are changing the way the world ages, one person and one day at a time. Hope is a powerful incentive, and aging doesn’t have to be a bad experience. We hope that you have enjoyed these articles and encourage you to call if you have any questions, would like more information, or want to schedule a free in home assessment of your, or a loved one’s, needs.
